

A360 x Boulevard: Deep Reference

Technical Integration, Strategic Analysis & Execution Roadmap

Boulevard Company Profile

Boulevard Labs, Inc. is a Los Angeles-based SaaS platform providing business management software for the self-care industry. Founded in 2016, they have grown to become the dominant scheduling and payment infrastructure for medical spas, salons, and wellness businesses.

Attribute	Detail
Valuation	\$800M (Series D, July 2025)
Total Funding	\$188M across 5 rounds
Customers	6,000+ businesses, 40,000+ professionals
Monthly Appointments	2M+ processed monthly
Annual Payment Volume	~\$5 billion
Medspa Market Share	15% of U.S. medspa market (3 years)
Revenue Growth	500%+ over 3 years
Key Investors	JMI Equity (lead), Index Ventures, VMG Partners
Series D AI Budget	\$80M earmarked for AI R&D;

Boulevard's AI Roadmap (Series D Stated Priorities)

Investment Area	Description	A360 Relevance
Smarter Client Recommendations	Personalized service/product suggestions based on history	DIRECT — A360 provides consultation-grounded intent
Service Menu Optimization	AI-driven menu refinement and pricing	DIRECT — TCP pricing intelligence
Client Experience Personalization	Intelligence-based customized recommendations	DIRECT — consultation content is the experience
Package/Promotion Development	Intelligent membership and promotion creation	ADJACENT — membership conversion signals

What Boulevard's AI Does NOT Do Today

Boulevard's AI is focused exclusively on operational efficiency — scheduling optimization, marketing automation, and support chatbot. Their own documentation confirms they do not currently provide:

Boulevard AI Gap	A360 Capability
Real-time consultation transcription	Deepgram Nova-3 with aesthetic medicine vocabulary
Clinical documentation (SOAP notes)	Evidence-bound notes, every statement transcript-linked
Conversational intelligence / coaching	25+ KPI frameworks, 42 coaching playbooks
Treatment planning with clinical rationale	TCP: Good/Better/Best with pricing and sequencing
Opportunity extraction from consultations	Revenue signals, cross-sell, financing detection
Provider performance analytics	Scored per consultation with transcript evidence
Compliance verification	Automated against configurable per-state checklists

A360 Platform Capabilities

A360 is a production-grade, HIPAA-compliant, multi-tenant AI intelligence platform. The platform was architected by a former CTO of CVS Health and built by 10+ engineers over 18 months. It is not a prototype — it is deployed, actively used by beta practices, and under continuous development.

Metric	Value
Lines of production code	~98,000 across Python, TypeScript, Swift
Repositories	77 across two GitHub organizations
Backend microservices	6 containerized on AWS ECS Fargate
REST API endpoints	140+
AI agents (production)	6 orchestrated via AWS Step Functions
Deployment environments	4 (sandbox, dev, staging, production)
AWS accounts	18 (isolated per environment and function)
Client applications	React 19 web app, native iOS (App Store), React Native (dev)
KPI evaluation frameworks	25+
Domain coaching playbooks	42
Development hours invested	~18,000

The Six Production AI Agents

Agent	Purpose	Model
Medical Relevance	Gatekeeper — filters non-clinical transcripts	Claude Haiku
Clinical Notes	SOAP documentation, Explant SOAP, Venous Notes	Claude Sonnet
Treatment Care Plan	Tiered recommendations (Good/Better/Best) with pricing	Claude Sonnet
Follow-Up Email	Personalized patient communication draft	Claude Sonnet
Clarifying Questions	Identifies information gaps from consultation	Claude Sonnet
Consultation Summary	Patient-friendly visit summaries	Claude Sonnet

Validated Revenue Impact

Metric	Before A360	With A360
Documentation time per consultation	10-15 minutes	Near zero (automated)
Treatment plans provided to patients	Rare / handwritten	100% branded, priced, sequenced
Follow-up personalization	Generic templates or none	Consultation-specific, automated
Provider performance visibility	None / anecdotal	Scored per consultation with evidence
Revenue signal capture	Lost at end of visit	100% extracted and actionable
Revenue uplift (beta validated)	Baseline	20% standard / 35%+ full pipeline

Technical Integration Architecture

Technology Stack Alignment

Layer	Boulevard	A360	Alignment
Cloud Provider	AWS	AWS	EXCELLENT
Database	PostgreSQL	Aurora PostgreSQL	EXCELLENT
Frontend	React + TypeScript + Redux	React 19 + TypeScript + Zustand	EXCELLENT
Real-time	WebSockets	WebSockets + Kinesis	EXCELLENT
Auth	OAuth2 / Okta	AWS Cognito OAuth2	GOOD — federable
API Architecture	GraphQL (Absinthe)	REST + AppSync GraphQL	GOOD — bridgeable
Message Queue	Kafka + Redis MQ	Kinesis + SQS	GOOD — AWS equiv.
Backend Language	Elixir	Python 3.12	SEPARATE — by design
Mobile	React Native	Swift UIKit (iOS)	COEXIST
Infrastructure as Code	AWS CDK (confirmed)	AWS CDK (19+ stacks)	EXCELLENT

Integration Architecture Decision

The correct integration architecture is Sidecar (Phase 1) transitioning to Lift-and-Integrate (Phase 2). A full rewrite of A360's Python AI services in Elixir is never the right answer — Python is the dominant ML/AI engineering language and rewriting 18,000 hours of domain-encoded work destroys the asset.

Path	Description	Timeline	Risk
Sidecar (Phase 1)	A360 runs as independent service cluster behind Boulevard API gateway. Deep API integration, no stack merge.	Weeks to production	LOW
Lift and Integrate (Phase 2)	A360 microservices migrate into Boulevard AWS org. Auth replaced. Data synced. Frontends merged as MFES.	12-24 months	MEDIUM

Path	Description	Timeline	Risk
Full Rewrite	A360 Python services rewritten in Elixir.	24-36 months	VERY HIGH — do not do this

Boulevard API Integration Points

Boulevard's Admin GraphQL API (47 queries, 119 mutations, 19 webhook categories) provides full bidirectional integration capability. Key touchpoints:

Direction	Boulevard API	A360 Action
INBOUND	appointment.created webhook	Create consultation, pre-load patient context
INBOUND	appointment.completed webhook	Trigger 6-agent AI processing pipeline
INBOUND	client query	Load patient history, preferences, membership status
INBOUND	services / products queries	Ground TCP in practice catalog with validated pricing
INBOUND	memberships query	Detect membership upsell signals and conversion readiness
OUTBOUND	createClientNote mutation	Write SOAP note to patient Boulevard record
OUTBOUND	bookingAddAppointmentTags	Tag consultation with KPI and revenue signals
OUTBOUND	bookingCreate + bookingAddService	Convert TCP recommendations to booking cart
OUTBOUND	orderCreate + orderAddProductLine	Convert TCP to Boulevard order for checkout
OUTBOUND	createManualAudience + addClients	Sync A360 opportunity segments to Boulevard marketing

Integration Lift: Notes + Intelligence Scope

Scoping to Notes + Intelligence (not TCP) is the correct initial approach. It eliminates catalog sync complexity, pricing logic, and HITL workflow requirements. The value proposition becomes a single sentence: 'When the appointment ends, the note is already in Boulevard and the appointment is tagged with every intelligence signal from the consultation.' That closes deals. TCP comes in Phase 2.

6-8 Week Build Plan

Component	Effort	Team	Description
Webhook receiver	1 week	Backend	FastAPI endpoints for appointment.created and appointment.completed. Patient identity resolution triggered on receipt.
Patient identity resolution	1 week	Backend	Map boulevard_client_id to A360 patient_id. Email/phone match fallback. One Alembic migration adding boulevard_client_id FK column.
Boulevard GraphQL client	1 week	Backend	Python GraphQL client against Boulevard Admin API. Pre-load client history, services, membership on consultation creation.
SOAP note write-back	3 days	Backend	createClientNote mutation. Notes already generate — this is the delivery mechanism only.
Intelligence tagging	3 days	Backend	bookingAddAppointmentTags. Map A360 KPI outputs to Boulevard tag vocabulary (high-intent, financing-candidate, etc.).
Auth bridge (SSO)	1 week	Backend	OIDC federation between Boulevard OAuth2 and A360 Cognito. Providers use single Boulevard login — no separate A360 credentials.
Embedded scribe widget	2 weeks	Frontend	A360 scribe React component packaged as Webpack MFE module. Live transcription visible inside Boulevard appointment view.

Team Required

The AI pipeline already runs. Notes already generate. The integration work is delivery mechanism, not intelligence building.

Role	Focus	Duration
1 Backend engineer	Webhooks, identity resolution, GraphQL client, write-back mutations	6-8 weeks
1 Frontend engineer	MFE widget packaging, auth bridge, Boulevard embed	4-6 weeks
Technical lead (Chris)	Boulevard API decisions, domain logic, product direction, Boulevard relationship	Full duration

What Does NOT Need to Be Built in Phase 1

Deferred Feature	Reason
TCP to Boulevard booking cart	Requires catalog sync, pricing logic, HITL workflow — Phase 2
Coaching dashboard MFE	High value but not required to prove core thesis
Compliance agents dashboard	Enterprise feature — Phase 3
Audience segment sync	Marketing suite integration — Phase 2
Offerings Service migration	18-month catalog convergence project — irrelevant now
Database convergence	Not needed for sidecar architecture
Full iOS app rebrand	Functional today — cosmetic rebrand deferred

Acquisition vs. Partnership Analysis

The strategic case for Boulevard acquiring A360 rather than pursuing a partnership or building internally:

Why Partnership Is Insufficient

A revenue-share integration or API partnership creates value but leaves both companies permanently exposed:

Risk	A360 Exposure	Boulevard Exposure
Competitive learning	Boulevard learns the category, builds internally in 18-24 months	—
Partner defection	—	Competitor acquires A360 exclusively; Boulevard loses access
Data flywheel fragmentation	Neither party gets the full data picture needed for compounding intelligence	Neither party gets the full data picture needed for compounding intelligence
Enterprise sales friction	Two contracts, two pitches, two onboarding flows for every enterprise customer	Two contracts, two pitches, two onboarding flows for every enterprise customer
Product philosophy violation	Boulevard's 'built-in not bolted-on' principle violated — A360 is visibly bolted on	Boulevard's 'built-in not bolted-on' principle violated — A360 is visibly bolted on

Acqui-Hire Framing (Recommended Given Current Stage)

Given A360's current state — production platform, validated metrics, minimal customer traction — the optimal transaction structure is an acqui-hire with performance earn-out:

Component	Description
Asset acquisition	A360 IP, codebase, infrastructure, domain knowledge assets acquired
Team retention	Engineering team joins Boulevard with standard retention packages
Founder role	Chris Cabell joins as VP/Head of Clinical Intelligence — owns integration roadmap and clinical product direction
Earn-out structure	Performance milestones tied to integration deployment, customer adoption, and revenue uplift metrics across Boulevard customer base
Why this works	Eliminates acquisition risk for Boulevard (team stays, knowledge transfers). Gives A360 the distribution needed to prove the thesis at scale.

Alternative: Co-Development Agreement

If Boulevard requires more evidence before acquisition, a co-development agreement de-risks both sides while building toward the transaction:

Phase	Structure	Duration	Outcome
Pilot	Boulevard funds 10-customer pilot. A360 delivers Notes + Intelligence integration. Pre-negotiated acquisition terms defined.	90 days	Live integration, measurable revenue uplift data
Validation	Audit pilot metrics. Assess customer adoption, NPS, revenue impact across 10 practices.	30 days	Go/no-go decision on acquisition with real data
Transaction	Acquisition at pre-negotiated terms, adjusted for pilot performance.	30-60 days	Full acquisition completed

Revenue Impact at Boulevard Scale

Boulevard processes 2M+ appointments monthly across 6,000+ businesses. Applying A360's validated intelligence to that volume:

Assumption	Value	Source
Monthly appointments (Boulevard)	2,000,000+	Boulevard public data
Estimated consultation % of appointments	~25-30%	Industry estimate
Consultation appointments per month	~500,000-600,000	Derived
Average consultation revenue value	~\$600-900	Aesthetics industry average
A360 validated revenue uplift	20% (35%+ full pipeline)	Beta validated
Incremental revenue per consultation	\$120-180	Derived
Total incremental revenue at full penetration	\$60M-108M per month	Across Boulevard network
A360 revenue share at 2-3%	\$1.2M-3.2M per month	Conservative partnership economics

The specific revenue share numbers are illustrative — the point is not to claim a precise figure. The point is that A360's value creation at Boulevard scale dwarfs any reasonable acquisition price. The asset is worth dramatically more inside Boulevard's distribution network than it is standalone.

Comparable Market Transactions

Company	Transaction	Value	Thesis
Nuance / DAX	Acquired by Microsoft	\$19.7B	Clinical conversation capture as intelligence infrastructure for hospital medicine
Abridge	Series C + Epic embed	\$850M raised / \$2.5B+ valuation	Consultation intelligence layer for hospital EHR — same thesis, hospital context
Oracle Health	Platform rebuild around AI	Multi-billion investment	Structured clinical conversation data as platform foundation

The playbook is consistent across all three: capture the clinical conversation, extract intelligence, use it to drive every downstream workflow. A360 brings this playbook to aesthetic medicine — a better market than hospital medicine for this thesis because the consultation is the revenue event directly, not just a documentation event.

Risk Assessment

Risks Boulevard Should Acknowledge

Risk	Level	Mitigation
Customer traction (6 beta practices)	REAL	Co-development pilot with 10 Boulevard customers generates the evidence before acquisition commitment
HIPAA compliance overlay on Boulevard infrastructure	SIGNIFICANT	PHI stays in A360's HIPAA-certified AWS accounts during Phase 1. Clean boundary documented and audited before any data migration.
Backend language mismatch (Elixir vs Python)	LOW	Python AI services are never rewritten. They run as a separate service cluster — Boulevard's Elixir and A360's Python are complementary, not competing.
Offerings Service duplication	MEDIUM	Explicit Phase 2 migration plan: Boulevard catalog becomes authoritative over 18 months. A360 Offerings deprecated gracefully.
Team retention post-acquisition	MEDIUM	Standard retention packages, founder role with product ownership, earn-out tied to integration success.
Competitive window closing	MEDIUM	First-mover advantage is real but not permanent. A well-funded competitor could build in 18-24 months. Speed matters.

The Honest Assessment for A360 Leadership

A360 has built something technically significant. The platform is real, the architecture is sound, and the revenue impact is validated. The gap is customer traction — six beta practices is a proof of concept, not a scaled product. This is not fatal to the conversation, but it must be addressed directly:

What A360 Has	What A360 Lacks
Production-grade platform (18,000 hours)	Scale (6 practices, not 600)
Validated revenue uplift (20% in beta)	Audited revenue data at volume
HIPAA-compliant infrastructure	Enterprise customer references
Complete technical integration analysis	Signed LOIs or pipeline
Domain expertise encoded in 42 playbooks	Runway to negotiate from strength
AWS-native, same infra as Boulevard	Time — runway is constrained

The recommended approach: do not hide the traction gap — address it proactively. "We built the infrastructure first, intentionally. We optimized for getting it right before scaling. The pilot converts our 6 practices into 16. Your customers become the validation." This is a credible position. Pretending the traction gap does not exist is not.

Phased Execution Roadmap

Phase 1 — Webhook and Identity Foundation (Weeks 1-6)

Deliverable	Owner	Dependencies
boulevard_client_id FK column (Alembic migration)	Backend	Boulevard enterprise API access
Patient identity resolution service	Backend	Boulevard client query access
Webhook receiver: appointment.created	Backend	Boulevard webhook subscription
Webhook receiver: appointment.completed	Backend	Above
Boulevard GraphQL client (patient context pre-load)	Backend	GraphQL API credentials
SOAP note write-back (createClientNote)	Backend	Notes agent running (already is)
Appointment tag write-back (KPI signals)	Backend	Above
OIDC auth bridge (Boulevard SSO)	Backend	Boulevard OAuth2 app registration

Phase 2 — Embedded Intelligence Widget (Weeks 6-10)

Deliverable	Owner	Dependencies
A360 scribe widget packaged as Webpack MFE	Frontend	Boulevard MFE framework access
Live transcription display in Boulevard appt view	Frontend	Widget above + WebSocket tunnel
Real-time signal overlay (buy signals, objections)	Frontend	A360 real-time extraction running
Coaching prompt overlay (provider-facing)	Frontend	Above
Note delivery notification in Boulevard UI	Frontend	Phase 1 write-back complete

Phase 3 — TCP and Commerce Integration (Months 3-6)

Only after Notes + Intelligence is live and validated with real Boulevard customers.

Deliverable	Complexity	Value
TCP widget MFE (Good/Better/Best presentation)	Medium	Patient leaves with plan in hand
Catalog sync: Boulevard services/products cached in A360	Medium	TCP grounded in live practice pricing
bookingCreate mutation chain (TCP to booking cart)	High	One-tap booking from TCP recommendation
orderCreate + orderAddProductLine (TCP to order)	Medium	Direct checkout from treatment plan
Audience segment sync (A360 signals to Boulevard marketing)	Medium	Consultation-grounded campaign targeting
Membership conversion trigger (from A360 signal)	Medium	Automated membership upsell workflow

Phase 4 — Enterprise Intelligence Suite (Months 6-12)

Deliverable	Target Customer
Provider coaching dashboard MFE (per-consultation scores with transcript evidence)	All Boulevard practices
Multi-location benchmarking (chain vs network, location vs location)	PE-backed multi-location groups
Automated compliance verification dashboard (per-state config)	Medical spa enterprise accounts
Consultation-aware campaign triggers (Reach + Boulevard marketing)	All Boulevard practices
Combined analytics: consultation intelligence + booking outcomes	Boulevard enterprise reporting

The Closing Argument

What to Say in the Room

Opening	"You told your Series D investors you are building smarter client recommendations and client experience personalization. We have already built it. Not a prototype — 18,000 engineering hours, production infrastructure, HIPAA-compliant, running on AWS exactly like you. The question is not whether this should exist inside Boulevard. You already told the market it should. The question is whether you spend 2 years and \$10M building it, or 90 days integrating what is already done."
The gap	"Boulevard knows when patients arrive, what they paid, and whether they rebooked. You have no access to what was said, what was recommended, what objections were raised, or why the close happened or did not. The consultation — the highest-revenue-per-minute moment in the patient journey — is invisible to your platform. A360 makes it visible."
The data	"When an appointment completes in Boulevard, A360 generates a clinical note and writes it to the patient record automatically. The appointment is tagged with every revenue signal from that conversation — intent level, financing interest, cross-sell opportunities, compliance status. Zero new workflow for the provider. The note is done before they reach the front desk."
The ask	"We are not asking you to buy a company based on 6 customers. We are asking you to fund a 90-day pilot with 10 of your medspa customers. We deliver the integration. You see the revenue uplift in your own customer data. We negotiate acquisition terms before the pilot starts. Your customers become the validation."

BOTTOM LINE: Boulevard's vision is transforming client experience. The consultation IS the client experience. A360 is the only production-ready platform in the market that makes the consultation visible, structured, and actionable inside a practice management platform. The technology is built. The thesis is validated. The integration is architected. The only question is who owns this combination — Boulevard, or whoever moves next.
